

## Xerographic Components - IOT Module

---

### Developer Assembly

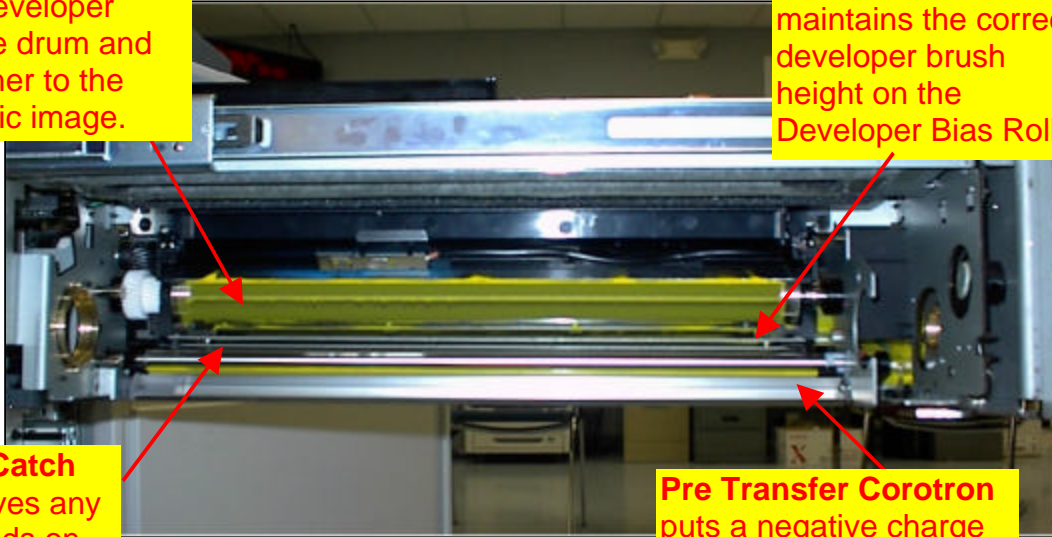

Each of the four Developer Assemblies contains a Developer Motor, Magnetic Bias Roll, and internal augers. Together the components mix and supply the toner needed to develop the toner image on the drum surface

**Developer Bias Roll** is a magnetic roll that brushes developer against the drum and applies toner to the electrostatic image.

**Trimmer Bar** maintains the correct developer brush height on the Developer Bias Roll

**Magnetic Catch Roll** removes any carrier beads on the Drum

**Pre Transfer Corotron** puts a negative charge on the image to loosen the toner prior to transfer
